BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

The antagonist modulates growth of epithelial (and related) cells and can be use diagnostically or therappeutically, eg to treat proliferative diseases of eyes and kidneys, some types of tumours and adrenal vascularisation. It is able to bind with heparin or with the FGF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Bovine; basic fibroblast growth factor; antagonist; mitogen; melanoma; glomerulonephritis; retinopathy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      P81933
                                                 Using plasmid pTB796, E.coli MM294 was transformed, whereby the strain E.coli MM294/pTB796 was obtained, which (IFO 14701, FERM BP-1 harbors the plasmid pTB796 expressing the mutein represented here. The amino acid sequence Lys 87 to Ser 147 has been deleted. The mutein has high stability and is low in toxicity. The mutein has high stability and is low in toxicity. Wounds or postoperative tissues or as a therapeutic drug based on its angiogenic action for e.g. thrombosis or arteriosclerosis. It can all be used as a reagent for acceleration of cell cultivation. A mutein where at least one constituent cysteine is replaced by serine is preferred because the mutein is highly stable and intermolecular briand of linkscape are advanced or called the stable and intermolecular briand of linkscape are advanced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human basic fibroblast growth factor; human bFGF mutein C86; growth promoting activity; growth stimulating activity; phage M13-PC86; capillary endothelial cells; angiogenic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Key

                                                                                                                                                                                      The C-terminal group is -NH2 or -OH. The invention also covers fragments of this peptide which retain the ability to bind with heparin or with the FGF receptor. The sequence includes the basic FGF. They are also antagonistic constitutes residues 107-110 of modulate growth of epithelial (and related) cells and can be used diseases of eyes and kidneys, some types of tumours and adrenal recommendations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             vascularisation.

                                                                                                                                                                                                                                                                                                                                          Peptides having the sequence of amino acids 93-135 of bFGF (R43274) or C-terminally truncated fragments which contain the sequence YRSRYSSWY are claimed. The peptides are FGF antagonists and can be used to regulate cell growth and proliferative diseases.

N.B. the sequence given in Claim 1 and assigned GENESEQ Accession No. R43275 includes an additional Tyr residue between Tyr115 and Vall16; this residue does not, however, appear in any of the peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New fibroblast growth factor peptide(s) - are FGF antagonists used to inhibit cell growth in culture or in disease e.g. retinopathy, glomerulonephritis, melanoma etc.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Any naturally occuring fibroblast growth factor (FGF) containing one of the sequences described in R65930-R65935, into which at least one artificial glycosylation site has been induced, where the site/s are glycosylated with sugar chains selected from the following group N-acetyl glycosamine, N-acetyl galactosamine, mannose, galactose, fucose and cyalic acid, is claimed. These muteins have improved stability, intracellular productivity and cell growth promoting activity, they can also be produced in larger amounts than FGF isolated from natural sources. The muteins can be used in the treatment of traumas and burns, and in the production of a preventative therapeutic medicine for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fibroblast growth factor; FGF; glycosylation sites; traumas; burns; thrombosis; arteriosclerosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                   The peptide is a bovine basic fibroblast growth factor. Truncated analogues of this peptide (esp. comprising residues 24-68) can be used as bogs antagonists, and can therefore interact or inhibit the peptide analogues can be used in human and other cell growth. The diagnosing and treating vasoproliferative diseases of the eye (e.g. chondrosarcoma), adrenal vascularisation and to inhibit neovascularisation of solid tumours. The peptide analogue should other cell growth that so be effective in combating the growth of human and coinhibit other melanocytes and the growth promotion of certain related oncogenes such as hst/K53.                                                                                                                                                                                                                                                                                                                                               FGF may be synthesised using recombinant DNA techniques (see also Q29741). This peptide is biologically active and exhibits either no or random disulphide bonding within the molecule. This protein, an analogue, a biologically active fragment, or a non-toxic salt of it may be used in a pharmaceutical composition for diagnostic or therapeutic uses. This may be used in in vitro cell proliferation procedures, eg. nerve regeneration and wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                  This substantially pure protein was purified from partially purified basic fibroblast growth factor (FGF) by cation exchange HPLC and two reverse-phase HPLC steps. Having purified this protein to apparent homogeneity the amino acid sequence can be determined and pure basic

The published AA sequence of bovine basic FGF was used as a basis for the synthesis of mfd. bFGF gene for expression in E. coli. The nucleotide sequence of this mfd. gene includes codons most often used by E. coli and to both strands of the gene were synthesized in overlapping sections and assembled into 2 larger sections by hybridation and subsequent ligation. The 2 larger sections were then cloned into an approp. phage vector (M13mp18) for nucleotide sequence analysis. The sections were then
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

Bovine and human basic FGF are known to differ by only two AAs. Site directed mutagenesis was used to convert the bovine gene into one coding for the human FGF (see FT). The FGF is a potent mitogen for a wide variety of eclls of mesodermal origin and may be chemotactic for endothelial cells and fibroblasts. The basic FGF induces neovascularisation and may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   101

Isolated sequences are used in vector construction etc. and used to transform CV-1 cells for FGF prodn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide

                                                                                                                                                                                                                                                                                                                                                                                             W20029 is a recombinant bovine basic fibroblast growth factor (bFGF). Recombinant bFGF is used to promote healing of wounds, bone fractures, damaged myocardial tissue etc. and, since it increases neuronal survival and promotes neurite outgrowth, may also be used in treatment of neurological disorders such as Alzheimer's and Parkinson's diseases. bFGF may also be used for detection of specific inhibitors; for treatment of cell cultures in vitro before transplant and for inducing release of tissue plasminogen activator or collagenase, e.g. for treatment of a chronic tendency to form embolism. Recombinant bFGF can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New high purity, recombinant human basic fibroblast growth factor for promoting wound healing and treating neuro:degenerative diseases, suitable for production on large scale
                                                                                                                                                                                                                                                                                                                             Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC factor (YEGF) 110. VEGF is an angiogenic factor. VEGF proteins are used CC for the prevention or repair of injury to blood vessels or associated CC nonvascular tissues (served by the blood vessels) and for the prevention CC and repair of vascular injury associated with microvascular angiopathy. CC with injury to, or atrophy of, the vasculature of the glomerulus and CC with injury to, or atrophy of, the vasculature of the glomerulus and CC syndrome, toxic/shock syndrome, venom exposure, chemical exposure, CC hypercoagulable states, platelet activation or aggregation, thrombosis, CC injury, pneumonia, infarction, ischemic bowel disease, transient ischemic CC attacks, stroke, hypoxia or hypercapnia or fibrosis arising from lung CC injury, pneumonia, pulmonary emboli, birth prematurity disorders, corgan allergic reactions, hypersensibitivity, autoimmune diseases, organ xxx xx transplants, focal glomerulosclerosis, and amyloidosis.

CC capillary permeability. The method is also useful in treating CC disorders related to abnormal transport of solutes across endothelial CC cells. Such disorders include the treatment or prevention of kidney CC disease associated with impaired filtration or excretion of solutes; CC the treatment or prevention of diseases of the central nervous system associated with alterations in cerebrospinal fluid, e.g. stroke, CC meningitis, tumour, infections, and bone growth disorders; treatment CC or prevention of hypoxia or hypercapnia or fibrosis arising from accumulation of fluid secrebrospinal fluid, e.g. stroke, CC mindistress syndrome, toxic alveolar injury, pneumonia, infections, CC surgical intervention, cystic fibrosis; treatment or prevention of CC gulmonary dysfunction arising from injury to the pulmonary for including disorders arising from premature birth, and CC endothelium, including disorders arising from premature birth, and CC pulmonary hypertension; treatment or prevention of disease arising CC from disordered transport of fluid and solutes across the intestinal CC epithelium, e.g. inflammatory bowel disease, diarrhoea; treatment or crevention of ascites accumulation in the peritoneum; enhancement of CC efficacy of solute flux; preservation or enhancement of function of corgan allografits; and treatment of cardiac valve disease. This cardiac valve disease. This cardiac transport is mediated by interaction CC with specific receptors on target tissues, most notably the vascular endothelium. VGEF exists as five different length monomer chains due to alternative splicing of the VGEF RNA transcript.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The two forms of VEFG (Q10797 and Q10917) which arise through CC different message splicing, have different properties. In partic. NPEGFI21 does not bind to heparin leaving more of the protein free to bind to VEGF receptor and increase the half-life and distribution of the protein in circulation, whereas hEEGF165 binds heparin strongly. The product can be used for angiogenesis and re-endothelialisation of inner vascular surfaces in wound healing, e.g. treatment of full-thickness wounds such as dermal ulcers, venous ulcers and diabetic culcers, burns, in surgery, in balloon angioplasty and for the in CC vitro culturing of endothelial cells. Hybrid growth factors of PDGF and VEGF can exhibit a mitogenic profile between each factor and cc can be used for wound healing or as inhibitors of angiogenesis for CC vEGF analogues in which CYS residues are substd. are more stable. CC See also Q10791-93; Q10796-97; Q10806-08 and Q11099.

                                                                                                                                                        A vaccine for treatment and prevention of diseases caused by vascularisation comprising a cell growth factor or its fragments which stimulate vascular cell proliferation is provided. The vaccine can be used for treating cancers, glaucoma, eye tumours, trachoma, psoriasis, granuloma, hypertrophic scars, post-crystalline fibrosis and senile disk muscular degeneration. A preferred protein for use in the vaccine is human VEGF/VPF121, i.e. the present sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence of Q44260 contains an open reading frame corresponding to the 165 amino acid human vascular endothelial cell growth factor (hVEGF-165, see R38921). Alternative splicing of the sequence gives a shorter coding sequence which encodes the 121 amino acid hVEGF (see R42507). The full-length coding sequences be generated using PCR with human foetal vascular smooth muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 3;

Several VPF types are known having 121, 165, 189 or 206 amino acids. This sequence was used to generate a series of overlapping peptides having 10 residues which w03678-9 generated the greatest antibody signal against the VPF protein. These clones were used to manufacture hybridomas producing monoclonal antibodies which are useful for diagnosis and treatment of cancers and

The monoclonal antibody of the invention (MVIO1) reacts with this hVPF sequence. MVIO1 does not, however, react with a peptide composed of ten successive residues of this sequence starting from an odd number from the N-terminus of this sequence (e.g. residues 1-10, residues 5-14, residues 47-56 etc.). The antibody can be used for diagnosis and treatment of cancer and other diseases. When it is used as an anti-cancer agent, it is preferably in the form of a chimeric or humanised antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vascular therapy;

                                                                                                                                                                         The patent discloses a vascularisation-controlling vaccine comprising a cell growth factor which specifically promotes growth of endothelial cells. The vaccine is typically used in immunotherapy to remedy disease caused by vascularisation, such as solid tunours, and to control the onset and recurrence of such diseases. Typical growth factors include vascular permeability factor (VPSF) and vascular endothelial growth factor (VEGF). The present sequence is that of human VEGF/VPF121.
                                                                                                                                                                                                                                                                                                                                          Vascularisation controlling vaccine - contains endothelial growth factor, used in the immunotherapy of solid tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             JP09316000-A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    W40597 standard;

The specification describes a monoclonal antibody which is specific to VEGF 121, and a hybridoma producing this antibody. The antibody is used in a method for measuring the amount of VEGF 121 present in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence

This represents a vascular endothelial growth factor-145 (VEGF145) which can be used to stimulate vascular cell proliferation. Polynucleotides encoding VEGF145 are useful for treatment of cardiovascular or vascular disease in mammals, especially humans. They are also useful for enhancing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes the novel preparation of biologically active dimers of recombinant human growth factors of the cysteine knot family starting from cellular inclusion bodies. Such dimers are are useful in pharmaceutical compositions and the method provides yields of 31-39,7%, in examples, compared with about 10% for the conventional method (see Biochemistry, 28 (1989) 2956). Y08278-Y08301 are human growth factor protein fragments used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      W56693 standard; Protein;

drug permeation by tumours. VEGF145 can also be administered to stimulate vascular cell proliferation or to enhance endothelialization of diseased vessels (especially re-endothelialization after angioplasty) in mammals. VEGF145, which binds as weakly as VEGF165 to heparin, binds much better than VEGF165 to the extracellular matrix (ECM). However, unlike VEGF189, VEGF145 is secreted from producer cells and binds efficiently to ECM. This combination of properties render VEGF145 the only known VEGF variant that is secreted from producing cells retaining at the same time ECM binding properties. This makes VEGF145 likely to diffuse towards the target blood vessels, while some of the produced VEGF145 will be retained by ECM components along the path of diffusion. This ECM bound pool will clissociate slowly allowing a longer period of activity. Additionally, the bloogleal activity of VEGF145 is protected against oxidative damage unlike VEGF forms such as VEGF121 thereby giving it a longer half-life.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                    This invention describes the novel preparation of biologically active dimers of recombinant human growth factors of the cysteine knot family starting from cellular inclusion bodies. Such dimers are useful in pharmaceutical compositions and the method provides yields of 31-39.7%, in examples, compared with about 10% for the conventional method (see Biochemistry, 28 (1989) 2955). Y08278-Y08301 are human growth factor
                                                                                                                                                                                                                                                                                                                                                                                                                     Erdmann
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Growth factor; human; dimer; cysteine knot; cellular inclusion body;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           망
The present sequence represents native human vascular endothelial growth (factor (VEGF) 145. VEGF is an angiogenic factor. VEGF proteins are used for the prevention or repair of injury to blood vessels or associated convascular tissues (served by the blood vessels) and for the prevention and repair of vascular injury associated with microvascular angiopathy, comparing the prevention and treatment of kidney diseases associated with injury to.or atrophy of, the vasculature of the glomerulus and conterstitium. Conditions which may be treated include haemolytic uremic syndrome, toxic shock syndrome, venom exposure, chemical exposure, thrombosis, preclampsia, thrombotic thrombocytopenia purpura, disseminated confiravascular coagulation, sehemic bowel disease, acute renal failure, compositation, ischemic bowel disease, transient ischemic compositation injury, acute respiratory distress syndrome, toxic alveolar condition, ischemic bowel distress syndrome, toxic alveolar condition, sepsia, pancreatis, acute renal failure, and tracks, stroke, hypoxia or hypercapnia or fibrosis arising from lung contents in the prevention of the proteins and tracks.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Best Local Similarity 100 Matches 15; Conservative

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence represent vascular endothelial conjugates, VEGF (or fragments of the invention. In the conjugates, VEGF (or fragments of it) are linked to a targeted agent VEGF receptor. Cys-modified forms of VEGF are particularly suitable for conjugation to linkers and targeted agents. The conjugates are can be used for treating a VEGF-mediated pathophysiological condition, solid tumours or an ophthalmic disorder of thyperproliferating blood vessels of the retina, iris, conjunctiva or cheumatoid arthritis, skin cancers and other tumours, or varicose veins.
           Isolated DNA sequences, expression vectors and transformant cells used for large scale prodn. of vascular endothelial cell growth factor, for treating wounds in which neo-vascularisation is

The present sequence represents native human vascular endothelial gractor (VEGF) 110. VEGF is an angiogenic factor. VEGF proteins are for the prevention or repair of injury to blood vessels or associate nonvascular tissues (served by the blood vessels) and for the prevent and repair of vascular injury associated with microvascular angiopa

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequences of the 8 possible exons encoding human vascular endothelial cell growth factor, together with contiguous splice junctions, were obtained from overlapping genomic inserts. A method for producing VBGF is claimed comprising culturing mammalian cells transformed with an expression vector containing exons I-V and VIII. See Q44261 for exon I and Q49604-Q49610 for exons II-VIII.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           48 cndeglecvptee 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        particularly thrombotic microangiopathy. The proteins methods may also be used for the prevention and treatment of kidney diseases associated with injury to, or atrophy of, the vasculature of the glomerulus and interstitium. Conditions which may be treated include haemolytic uremic syndrome, toxic shock syndrome, venom exposure, chemical exposure, preeclampsia, thrombotic thrombocytopenia purpura, disseminated intravascular coagulation, sepsis, pancreatis, acute renal failure, myocardial infarction, ischemic bowel disease, transient ischemic attacks, stroke, hypoxia or hypercapia or fibrosis arising from lung endothelium injury, acute respiratory distress syndrome, toxic alveolar injury, pneumonia, pulmonary emboli, birth prematurity disorders, wounds, allergic reactions, hypersensitivity, autoimmune diseases, organ translants focal almorations, hypersensitivity, autoimmune diseases, organ translants focal almorations.
Administering vascular endothelial growth factor (VGEF) can be used for treating hypertension (especially salt-dependent hypertension) Administration of VGEF promotes angiogenesis and/or vascular or capillary permeability. The method is also useful in treating disorders related to abnormal transport of solutes across endothelial cells. Such disorders include the treatment or prevention of kidney disease associated with impaired filtration or excretion of solutes;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vascular endothelial growth factor; human; angiogenesis; VGEF; capillary formation; hypertension; treatment; kidney; CNS; stroke; meningitis; central nervous system; tumour; infection; bone growth; hypoxia; hypercapnia; fibrosis; inflammatory bowel disease; diarrhoea; allografts; cardiac valve.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the treatment or prevention of diseases of the central nervous system cc associated with alterations in cerebrospinal fluid, e.g. stroke, cmeningitis, tumour, infections, and bone growth disorders; treatment or prevention of hypoxia or hypercappia or fibrosis arising from cc accumulation of fluid secretions in the lungs, e.g. acute respiratory conditions systematical intervention, cystic fibrosis; treatment or prevention of cc pulmonary dysfunction arising from injury to the pulmonary endothelium, including disorders arising from premature birth, and cc pulmonary hypertension; treatment or prevention of disease arising cc from disordered transport of fluid and solutes across the intestinal cc perthelium, e.g. inflammatory bowel disease, diarrhoea; treatment or prevention of asolute flux; preservation or enhancement of function of control of solute flux; preservation or enhancement of curvation of alteracty of solute flux; preservation or enhancement of function of control hyperity; and treatment of cardiac valve disease. This cc sequence is the native human vascular endothelial growth cf factor hyperity. The activity of VGEF is mediated by interaction conditions of the vascular endothelial growth conditions of the vascular sendothelial growth conditions of the vascular send
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         멍
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                bind to VEGF receptor and increase the half-life and distribution of the protein in circulation, whereas habsgri65 binds heparin strongly. The product can be used for angiogenesis and re-endothelialisation of inner vascular surfaces in wound healing, e.g. treatment of full-thickness wounds such as dermal ulcers, venous ulcers and diabetic vitro culturing of endothelial cells. Hybrid growth factors of PDGF and VEGF can exhibit a mitogenic profile between each factor and e.g. preventing the growth of tumours.

VEGF analogues in which CYS residues are substd. are more stable.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 to the 165 amino acid human vascular endothelial cell growth factor (hVEGF-165, see R38921). Alternative splicing of the sequence glves a shorter coding sequence which encodes the 121 amino acid hVEGF (see R42607). The full-length coding sequences be generated using PCR with human foetal vascular smooth muscle poly-A+ RNA as template.

                                                                                                                                                                               Ş
                                                                                                                                                                                                                                                                                 (VPF), a member of the growth factor family. Several VPF types are known having 121, 165, 189 or 206 amino acids. This sequence was used to generate a series of overlapping peptides having 10 residues which were used to raise antibodies against the VPF peptide. The two peptides W03678-9 generated the greatest antibody signal against the VPF protein. These clones were used to manufacture hybridomas producing monoclonal antibodies which are useful for diagnosis and treatment of cancers and

The monoclonal antibody of the invention (WVI01) reacts with this hVPF sequence. WVI01 does not, however, react with a peptide composed of ten successive residues of this sequence starting from an odd number from the N-terminus of this sequence (e.g. residues 1-10, residues 5-14, residues 47-56 etc.). The antibody can be used for diagnosis and treatment of cancer and other diseases. When it is used as an anti-cancer agent, it is preferably in the form of a chimeric or humanised antibody.
The sequence represents VPF121. The patent relates to short peptides derived from this sequence (see R93978
                                                                              Partial peptide(s) of VPF121 and anticancer agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Monoclonal antibody reacting with human vascular permeability factor useful for treatment and diagnosis of cancer and other diseases

                                                                                                                                                The patent discloses a vascularisation-controlling vaccine comprising a cell growth factor which specifically promotes growth of endothelial cells. The vaccine is typically used in immunotherapy to remedy diseases caused by vascularisation, such as solld tumours, and to control the onset and recurrence of such diseases. Typical growth factors include vascular permeability factor (VPF) and vascular endothelial growth factor (VEGF). The present sequence is that of human VEGF/VPF121.
                                                                                                                                         Sequence

The specification describes a monoclonal antibody which is specific to VEGF 121, and a hybridoma producing this antibody. The antibody is used in a method for measuring the amount of VEGF 121

This represents a vascular endothelial growth factor-145 (VEGF145) which can be used to stimulate vascular cell proliferation. Polynucleotides encoding VEGF145 are useful for treatment of cardiovascular or vascular disease in mammals, especially humans. They are also useful for enhancing drug permeation by tumours. VEGF145 can also be administered to stimulate vascular cell proliferation or to enhance endothelialization of diseased vessels (especially re-endothelialization after angioplasty) in mammals. VEGF145, which binds as weakly as VEGF165 to heparin, binds much better
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes the novel preparation of biologically active dimers of recombinant human growth factors of the cysteine knot family starting from cellular inclusion bodies. Such dimers are are useful in pharmaceutical compositions and the method provides yields of 31-39.7%, in examples, compared with about 10% for the conventional method (see Biochemistry, 28 (1989) 2956). Y08278-Y08301 are human growth factor
                                                                                                                                                       Vascular endothelial growth factor-145 splice variant - useful as angiogenic factor for treatment of cardiovascular disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Homo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               than VEGF165 to the extracellular matrix (ECM). However, unlike VEGF189, VEGF145 is secreted from producer cells and binds efficiently to ECM. This combination of properties render VEGF145 the only known VEGF variant that is secreted from producing cells retaining at the same time ECM binding properties. This makes VEGF145 likely to diffuse towards the target blood vessels, while some of the produced VEGF145 will be retained by ECM components along the path of diffusion. ECM bound pool will dissociate slowly allowing a longer period of activity. Additionally, the biological activity of VEGF145 is protected against oxidative damage unlike VEGF forms such as VEGF121 thereby giving it a longer half-life.
                                    This invention describes the novel preparation of biologically active dimers of recombinant human growth factors of the cysteine knot family starting from cyllular inclusion bodies. Such dimers are are useful in pharmaceutical compositions and the method provides yields of 31-39.7%, in examples, compared with about 10% for the conventional method (see Biochemistry, 23 (1989) 2956). Y08278-Y08301 are human growth factor

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Control the prevention or repair of injury to blood vessels or associated connivascular tissues (served by the blood vessels) and for the prevention of and repair of vascular injury associated with microvascular angiopathy. Control thrombotic microangiopathy. The proteins methods may also be used for the prevention and treatment of kidney diseases associated contenstitium. Conditions which may be treated include haemolytic uremic conformation with may be treated include haemolytic uremic conformations. The vasculature of the glomerulus and conformation which may be treated include haemolytic uremic conformation of spragation, thrombosis, intravascular coagulation, venom exposure, chemical exposure, conformation of the prevention of the glomerulus and conformation of the glomerulus and conformation of the glomerulus and conformation of the glomerulus and conformation, thrombosis, conformation, thrombosis, pancreatis, acute renal failure, conformation, ischemic bowel disease, transient ischemic conformation, promotion of the glomerulus arising from lung condothelium injury, acute respiratory distress syndrome, toxic alveolar conformation, promotion, but the prematurity disorders, conformation, hypersensitivity, autoimmune diseases, organ and anyloidosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

CC for treating hypertension (especially salt-dependent hypertension)
CC Administration of VGEF promotes angiogenesis and/or vascular or
CC capillary permeability. The method is also useful in treating
CC disorders related to abnormal transport of solutes across endothelial
CC disease associated with impaired filtration or prevention of kidney
CC disease associated with impaired filtration or prevention of solutes;
CC meningitis, tumour, infections in cerebrospinal fluid, e.g. stroke,
CC or prevention of fluid secretions in the lungs, e.g. acute respiratory
CC distress syndrome, toxic alveolar injury, pneumonia, infections,
CC gulmonary dysfunction arising from injury prevention of
CC pulmonary dysfunction arising from injury to the pulmonary
CC endothelium, including disorders arising from prevention of
CC pulmonary hypertension; treatment or prevention of
CC pulmonary hypertension; treatment or prevention of disease arising
CC epithelium, e.g. inflammatory bowel disease, diarrhoea; treatment or
CC efficacy of solute flux; preservation or enhancement of function of
CC corgan allografts; and treatment of cardiac valve disease. This
CC sequence is the native human vascular emothelial growth
CC endothelium. VGEF exists as five different length monomer chains due

CC endothelium. VGEF exists as five different length monomer chains due

CC contendative splicing of the VGEF RNA transcript.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; Figure 11; 51pp; English.
